Pipeline Quality Summary

This pipeline processes IoT sensor data through a 3-layer Medallion architecture with automated quality checks at every layer.

Bronze: Raw data ingested , nulls and duplicates expected and measured.

Silver: Strict validation applied -> 648 rows removed (6.6% of Bronze) by DLT expectations. Zero nulls, zero duplicates, zero range violations in output.

Gold: Business logic validated -> all 5 machines present, health scores within 0-100 range, anomaly rate within expected 1-20% band.
